

Sina Matari

Backend Developer

sinamatari23@gmail.com | +98 912 098 8771 | github.com/JupiterFromSpace

PROFESSIONAL SUMMARY

Backend developer with about a year of production-team experience and ongoing independent project work in Django and Django REST Framework. Comfortable with relational data modeling, JWT-based authentication, background task processing with Celery, and end-to-end deployment (Docker, Nginx, Gunicorn). Works well in small teams alongside frontend developers and designers, with a track record of making deliberate scope and cost trade-offs to ship working systems.

TECHNICAL SKILLS

Languages & Frameworks: Python, Django, Django REST Framework

API & Auth: RESTful API Design, JWT Authentication, API Security

Databases: PostgreSQL, SQLite, Database Modeling & Query Optimization

Async & Background Tasks: Celery, Redis (broker & caching)

DevOps & Infra: Docker, Docker Compose, Nginx, Gunicorn, CI/CD (GitHub Actions)

Testing & Tools: pytest, Git, GitHub, Postman, Swagger / OpenAPI

Currently Exploring: Elasticsearch, Django Channels / WebSockets, OAuth2, LLM integration & RAG pipelines (pgvector, LangChain)

WORK EXPERIENCE

Backend Developer (Intern)

Alborz Innovation Factory · 2024 (1 year)

- Worked as part of a 3-person team building a security-focused web platform, where authentication integrity, structured error handling, and consistent API response design were core requirements.
- Implemented and maintained REST API endpoints supporting several of the platform's features, from data validation through response formatting.
- Collaborated with frontend developers and designers, and participated in Git-based code review workflows.
- Gained hands-on experience with staging deployment and GitHub Actions CI/CD pipelines.

PROJECTS

Building Charge Management System (SharqBook)

Personal Project · github.com/JupiterFromSpace/sharqbook-backend

- Architected a modular Django REST Framework backend with three independent apps (accounts, buildings, finance), each with its own relational models on PostgreSQL.
- Designed JWT-based authentication with role-based access control for residents and building managers.
- Initially designed an SMS OTP authentication flow (sms.ir integration); after evaluating the added server and domain costs against project scope, made the deliberate decision to defer it and keep JWT as the primary auth layer.
- Built Celery background tasks with a Redis broker for scheduled payment reminders and notifications.
- Applied Redis caching to dashboard statistics and heavy aggregation queries to reduce database load.
- Deployed the application to a VPS with Docker, Gunicorn, and Nginx as a reverse proxy.
- Containerized the full stack with Docker Compose.

Other Backend Work

- Built several REST APIs with DRF covering authentication, CRUD operations, filtering, and pagination.
- Practiced test-driven development with pytest and the Django test client for unit and integration tests.

LANGUAGES

English — Advanced: reading technical documentation, writing, and communication.
